

A **Trading Journal App** is basically:

A system where users log their trades, analyze performance, and improve decision-making.

Core idea (keep it simple)

- Users manually enter trades (no broker API needed)
- App stores and displays trade history
- Basic analytics (profit/loss, win rate)
- Clean dashboard

Functional Requirements (What the system DOES)

These should be written like **system behaviors**.

1. User Management

- The system shall allow users to register with name, email, and password
- The system shall allow users to log in using valid credentials
- The system shall allow users to log out securely
- The system shall allow users to update their profile information

2. Trade Management (Core Feature)

- The system shall allow users to add a new trade
- The system shall allow users to edit existing trades
- The system shall allow users to delete trades
- The system shall store trade details including:

- Asset name
- Trade type (Buy/Sell)
- Entry price
- Exit price
- Trade date
- Notes

3. Trade Calculations

- The system shall automatically calculate profit or loss for each trade
- The system shall calculate total profit/loss across all trades
- The system shall calculate win rate (%)
- The system shall display number of total trades

4. Trade History

- The system shall display all trades in a tabular format
- The system shall allow users to sort trades by date or asset
- The system shall allow users to filter trades by date range

5. Dashboard & Analytics

- The system shall display a summary dashboard
- The system shall visualize profit/loss trends (basic chart optional)
- The system shall display key metrics:
 - Total trades
 - Win rate
 - Net profit/loss

6. Search & Filter

- The system shall allow users to search trades by asset name
- The system shall allow filtering by trade type (Buy/Sell)

7. Trade Notes / Reflection (Nice Feature)

- The system shall allow users to add notes for each trade
- The system shall store user reflections (e.g., mistakes, emotions)

8. Data Persistence

- The system shall store all user and trade data in a database
- The system shall retrieve data when the user logs in again

Non-Functional Requirements (How the system PERFORMS)

These are VERY important for marks—keep them realistic.

1. Performance

- The system should load pages within **2 seconds**
- The system should handle at least **50 concurrent users**
- Database queries should return results within **1 second**

2. Security

- User passwords must be encrypted (hashed)
- The system must prevent unauthorized access to user data
- Users should only access their own trades

3. Usability

- The system should have a simple and intuitive interface
- The system should be responsive (mobile + desktop)

- Users should be able to add a trade in less than **1 minute**

4. Reliability

- The system should be available **99% of the time**
- The system should prevent data loss during normal operation
- The system should validate user input to avoid errors

5. Maintainability

- The system should have modular and well-structured code
- The system should be easy to update or extend with new features
- Code should follow consistent naming and coding standards

6. Compatibility

- The system should work on major browsers (Chrome, Edge, Safari)
- The system should support both desktop and mobile devices

7. Scalability (Basic level)

- The system should allow future addition of features (e.g., charts, API integration)
- The database should support increasing number of users and trades

8. Data Integrity

- The system must ensure accurate calculations of profit/loss

The system must prevent invalid data entry (e.g., negative prices)
